

ARCHANA

RESUME SUMMARY

I am an Electronics and Communication Engineering student with basic knowledge of electronics, embedded systems, and artificial intelligence. I have worked on academic projects like Deep Learning-based Blood Group Detection using fingerprint and an AI-powered pest and disease detection system for pigeon pea crops. Through these projects, I gained practical knowledge in programming, machine learning, and circuit design. I am eager to learn new technologies and apply my skills in a professional environment.

SKILLS

- C Programming
- MATLAB
- Embedded Systems
- Python programming

SOFT SKILLS

- Communication Skill
- Problem-solving skill
- Leadership Quality
- Teamwork

LANGUAGES KNOWN

- English
- Kannada

PERSONAL DETAILS

Current Location: Kalburgi

Date of Birth: August 20,
2004 Female

EDUCATION

Graduation

Course: B.E. (Electronics and communication)
College: PDA College of Engineering
kalburgi Score: 6.76 CGPA

Schooling

Class XII

Class X

Board Name	Karnataka	Karnataka
Medium	English	Kannada
Year of Passing	2022	2020
Score	80.33%	65.12%

PROJECTS

AI powered pest and disease detection machine for pigeon pea:

Lead a team in the development of an AI powered system for early detection of pests and diseases in pigeon pea crops, aimed to improving yield and reducing manual monitoring. Utilized machine learning techniques for image-based detection and classification of crop condition. Over saw the project life cycle including data collection, modelled training, system integration and field testing. Enhanced team coordination, technical execution and problem-solving throughout the project.

Deep Learning based Blood Group Detection using Fingerprint:

As the team lead, I guided the development of a Deep Learning based System for blood group detection using fingerprint images. Our work involved collecting and preprocessing fingerprint datasets, enhancing ridge features, and applying CNN models with transfer learning to classify ABO and Rh blood groups. We ensured systematic experimentation, model evaluation, and validation using accuracy and confusion matrix metrics.

The project highlights a non-invasive, cost-effective approach to blood group prediction while acknowledging that it serves as a supportive tool and not a replacement for clinical test

Contactless Doorbell System:

Designed and implemented a contactless doorbell system using basic electronics components such as resistors, capacitors and infrared sensors. The system detects the presence of a hand or object near the sensor and triggers

the doorbell without physical contact, enhancing hygiene and user convenience. Gained practical experience in circuit design, component selection and system integration.
